

The code I actually used to test this was in the Startup code for a simple VSTO document, as follows...

```
private void ThisDocument_Startup(object sender, System.EventArgs e)
{
    foreach
    (Word.OMath math in
    this.Content.OMaths)
    {
        math.Range.CopyAsPicture();

        object PDT=Word.WdPasteDataType.wdPasteEnhancedMetafile;

        this.Application.Selection.PasteSpecial(ref missing, ref missing, ref missing, ref missing, ref PDT , ref missing,
ref missing);

        //How to convert to image.
    }
}
```

It just copies each OMath object in the document to the location defined by the current Selection.
